

How to Sync music on a Network Attached Storage with a Summit based Music Streamer (Solo/Duet/CS-200)

Within the Ovation Configuration Utility, select Manage => Remote Music Sources (NAS).

Mount Name: Something easy so you'll know what the sync is.

Machine IP: The IP address of the NAS.

Share Name: The main folder that is network shared.

Username: Any username that does not have a space in it.

Password: The password to the username.

Version: This is the SMB version that your NAS supports. Version 2 and 3 are recommended.

Here is an example of a NAS sync between a Solo and a Qnap NAS.

Add Remote Machine

Mount Name: Music Kind: SMB

Machine IP Address: 192.168.15.243 Share Name: Music

Username: Fusion Password: fusion1

Options: nounix,noserverino,sec=ntlmssp,vers=3.0

Version 1.0 Version 2.0 Version 3.0

Cancel OK

- 1) Once the NAS is synced, we'll need to add the folder that our system will use to find the locally stored music.
- 2) Select Manage => Media Server => Media Locations.
- 2) Now select Add and choose the location of your music collection, then select OK.
- 3) Lastly, select the Re-scan Library (Full) box and hit Apply.

Depending on how large the library is, this may take a bit of time for the system to complete the scanning process. As an example, our office library has around 45k tracks (roughly a 1TB of music) and it takes a little over an hour to complete the process.
